

Feedback — Week 1 - Problem Set

You submitted this homework on **Mon 14 Jan 2013 7:38 PM CST**. You got a score of **5.95** out of **8.45**. You can [attempt again](#) in 10 minutes.

Question 1

Data compression is often used in data storage and transmission. Suppose you want to use data compression in conjunction with encryption. Does it make more sense to:

Your Answer	Score	Explanation
<input type="radio"/> The order does not matter -- either one is fine.	 0.00	Ciphertexts tend to look like random strings and therefore compressing after encryption will not compress the data.
Total	0.00 / 1.00	

Question 2

Let $G : \{0, 1\}^s \rightarrow \{0, 1\}^n$ be a secure PRG. Which of the following is a secure PRG (there is more than one correct answer):

Your Answer	Score	Explanation
<input type="checkbox"/> $G'(k) = G(k) \parallel 0$ (here \parallel denotes concatenation)	 0.17	A distinguisher will output <i>not random</i> whenever the last bit of its input is 0.
<input checked="" type="checkbox"/> $G'(k_1, k_2) = G(k_1) \parallel G(k_2)$ (here \parallel denotes concatenation)	 0.17	a distinguisher for G' gives a distinguisher for G .

<input type="checkbox"/> $G'(k) = G(k) \parallel G(k)$ (here \parallel denotes concatenation)	✓	0.17	A distinguisher will output <i>not random</i> whenever the first n bits are equal to the last n bits.
<input checked="" type="checkbox"/> $G'(k) = G(k)[0, \dots, n-2]$ (i.e., $G'(k)$ drops the last bit of $G(k)$)	✓	0.17	a distinguisher for G' gives a distinguisher for G .
<input checked="" type="checkbox"/> $G'(k) = \text{reverse}(G(k))$ where $\text{reverse}(x)$ reverses the string x so that the first bit of x is the last bit of $\text{reverse}(x)$, the second bit of x is the second to last bit of $\text{reverse}(x)$, and so on.	✓	0.17	a distinguisher for G' gives a distinguisher for G .
<input type="checkbox"/> $G'(k) = G(0)$	✓	0.17	A distinguisher will output <i>not random</i> whenever its input is equal to $G(0)$.
Total		1.00 / 1.00	

Question 3

Let $G : K \rightarrow \{0, 1\}^n$ be a secure PRG. Define $G'(k_1, k_2) = G(k_1) \bigwedge G(k_2)$ where \bigwedge is the bit-wise AND function. Consider the following statistical test A on $\{0, 1\}^n$:

$A(x)$ outputs $\text{LSB}(x)$, the least significant bit of x .

What is $\text{Adv}_{\text{PRG}}[A, G']$? You may assume that $\text{LSB}(G(k))$ is 0 for exactly half the seeds k in K .

Note: Please enter the advantage as a decimal between 0 and 1 with a leading 0.
If the advantage is $3/4$, you should enter it as 0.75

You entered:

0.25

Your Answer	Score	Explanation
0.25	✓ 1.00	for a random string x we have $Pr[A(x) = 1] = 1/2$ but for a pseudorandom string $G'(k_1, k_2)$ we have $Pr_{k_1, k_2}[A(G'(k_1, k_2)) = 1] = 1/4$.
Total	1.00 / 1.00	

Question 4

Let (E, D) be a (one-time) semantically secure cipher with key space $K = \{0, 1\}^\ell$. A bank wishes to split a decryption key $k \in \{0, 1\}^\ell$ into two pieces p_1 and p_2 so that both are needed for decryption. The piece p_1 can be given to one executive and p_2 to another so that both must contribute their pieces for decryption to proceed.

The bank generates random k_1 in $\{0, 1\}^\ell$ and sets $k'_1 \leftarrow k \oplus k_1$. Note that $k_1 \oplus k'_1 = k$. The bank can give k_1 to one executive and k'_1 to another. Both must be present for decryption to proceed since, by itself, each piece contains no information about the secret key k (note that each piece is a one-time pad encryption of k).

Now, suppose the bank wants to split k into three pieces p_1, p_2, p_3 so that any two of the pieces enable decryption using k . This ensures that even if one executive is out sick, decryption can still succeed. To do so the bank generates two random pairs (k_1, k'_1) and (k_2, k'_2) as in the previous paragraph so that $k_1 \oplus k'_1 = k_2 \oplus k'_2 = k$. How should the bank assign pieces so that any two pieces enable decryption using k , but no single piece can decrypt?

Your Answer	Score	Explanation
 $p_1 = (k_1, k_2), \quad p_2 = (k'_1, k_2), \quad p_3 = (k'_2)$	✓ 1.00	executives 1 and 2 can decrypt using k_1, k'_1 , executives 1 and 3 can decrypt

using k_2, k'_2 , and executives 2 and 3 can decrypt using k_2, k'_2 . Moreover, a single executive has no information about k .

Question 5

Let $M = C = K = \{0, 1, 2, \dots, 255\}$ and consider the following cipher defined over (K, M, C) :

$$E(k, m) = m + k \pmod{256} \quad ; \quad D(k, c) = c - k \pmod{256} .$$

Does this cipher have perfect secrecy?

Your Answer	Score	Explanation
<input checked="" type="radio"/> No, only the One Time Pad has perfect secrecy.	 0.00	many constructions can have perfect secrecy.
Total	0.00 / 1.00	

Question 6

Let (E, D) be a (one-time) semantically secure cipher where the message and ciphertext space is $\{0, 1\}^n$. Which of the following encryption schemes are (one-time) semantically secure?

Your Answer	Score	Explanation
<input type="checkbox"/> $E'(k, m) = E(k, m) \parallel k$	 0.17	To break semantic security, an

			attacker would read the secret key from the challenge ciphertext and use it to decrypt the challenge ciphertext. Basically, any ciphertext reveals the secret key.
<input type="checkbox"/> $E'((k, k'), m) = E(k, m) \parallel E(k', m)$	✗	0.00	an attack on E' gives an attack on E .
<input checked="" type="checkbox"/> $E'(k, m) = \text{reverse}(E(k, m))$	✓	0.17	an attack on E' gives an attack on E .
<input type="checkbox"/> $E'(k, m) = \text{compute } c \leftarrow E(k, m) \text{ and output } c \parallel c$ (i.e., output c twice)	✗	0.00	an attack on E' gives an attack on E .
<input type="checkbox"/> $E'(k, m) = E(0^n, m)$	✓	0.17	To break semantic security, an attacker would ask for the encryption of 0^n and 1^n and can easily distinguish $\text{EXP}(0)$ from $\text{EXP}(1)$ because it knows the secret key, namely 0^n .

✓ $E'(k, m) = E(k, m) \parallel \text{LSB}(m)$

0.00

To break semantic security, an attacker would ask for the encryption of 0^n and $0^{n-1}1$ and can distinguish $\text{EXP}(0)$ from $\text{EXP}(1)$.

Your Answer	Score	Explanation
09e1c5f70a65ac519458e7f13b33	✓ 1.00	
Total	1.00 / 1.00	

Question 8

The movie industry wants to protect digital content distributed on DVD's. We develop a variant of a method used to protect Blu-ray disks called [AACS](#).

Suppose there are at most a total of n DVD players in the world (e.g. $n = 2^{32}$). We view these n players as the leaves of a binary tree of height $\log_2 n$. Each node in this binary tree contains an AES key k_i . These keys are kept secret from consumers and are fixed for all time. At manufacturing time each DVD player is assigned a serial number $i \in [0, n - 1]$. Consider the set of nodes S_i along the path from the root to leaf number i in the binary tree. The manufacturer of the DVD player embeds in player number i the keys associated with the nodes in the set S_i . A DVD movie m is encrypted as

$$E(k_{\text{root}}, k) \parallel E(k, m)$$

where k is a random AES key called a content-key and k_{root} is the key associated with the root of the tree. Since all DVD players have the key k_{root} all players can decrypt the movie m . We refer to $E(k_{\text{root}}, k)$ as the header and $E(k, m)$ as the body. In what follows the DVD header may contain multiple ciphertexts where each ciphertext is the encryption of the content-key k under some key k_i in the binary tree.

Suppose the keys embedded in DVD player number r are exposed by hackers and published on the Internet. In this problem we show that when the movie industry distributes a new DVD movie, they can encrypt the contents of the DVD using a slightly larger header (containing about $\log_2 n$ keys) so that all DVD players, except for player number r , can decrypt the movie. In effect, the movie industry disables player number r without affecting other players.

As shown below, consider a tree with $n = 16$ leaves. Suppose the leaf node labeled 25 corresponds to an exposed DVD player key. Check the set of keys below under which to encrypt the key k so that *every player* other than player 25 can decrypt the DVD. Only four keys are needed.

Your Answer	Score	Explanation
<input type="checkbox"/> 0	✓ 0.03	No, this will let node 25 decrypt the DVD.
<input checked="" type="checkbox"/> 1	✓ 0.03	You cannot encrypt k under the root, but 1's children must be able to decrypt k .
<input type="checkbox"/> 2	✓ 0.03	No, this will let node 25 decrypt the DVD.
<input checked="" type="checkbox"/> 6	✓ 0.03	You cannot encrypt k under 2, but 6's children must be able to decrypt k .
<input type="checkbox"/> 16	✓ 0.03	There is a better solution that does not require encrypting on the key of this node.
<input checked="" type="checkbox"/> 26	✓ 0.03	You cannot encrypt k under any key on the path from the root to node 25. Therefore 26 can only decrypt if you encrypt k under key k_{26} .
<input type="checkbox"/> 22	✓ 0.03	There is a better solution that does not require encrypting on the key of this node.
<input checked="" type="checkbox"/> 11	✓ 0.03	You cannot encrypt k under key 5, but 11's children must be able to decrypt k .

Question Explanation

Question explanation

Question 9

Continuing with the previous question, if there are n DVD players, what is the number of keys under which the content key k must be encrypted if exactly one DVD player's key needs to be revoked?

Your Answer	Score	Explanation
<input checked="" type="radio"/> $\log_2 n$	✓ 1.00	That's right. The key will need to be encrypted under one key for each node on the path from the root to the

revoked leaf. There are $\log_2 n$ nodes on the path.

-------	----------------

Question 10

Continuing with question 8, suppose the leaf nodes labeled 16, 18, and 25 correspond to exposed DVD player keys. Check the smallest set of keys under which to encrypt the key k so that every player other than players 16,18,25 can decrypt the DVD. Only six keys are needed.

Your Answer	Score	Explanation
<input type="checkbox"/> 22	✓ 0.02	
<input checked="" type="checkbox"/> 11	✓ 0.02	Yes, this will let players 23,24 decrypt.
<input checked="" type="checkbox"/> 4	✓ 0.02	Yes, this will let players 19-22 decrypt.
<input type="checkbox"/> 3	✓ 0.02	
<input type="checkbox"/> 0	✓ 0.02	No, this will let everyone decrypt, including the revoked players.
<input checked="" type="checkbox"/> 15	✓ 0.02	Yes, this will let player 15 decrypt.
<input checked="" type="checkbox"/> 26	✓ 0.02	Yes, this will let player 26 decrypt.
<input type="checkbox"/> 21	✓ 0.02	
<input checked="" type="checkbox"/> 6	✓ 0.02	Yes, this will let players 27-30 decrypt.
<input checked="" type="checkbox"/> 17	✓ 0.02	Yes, this will let player 17 decrypt.
